FLORIDA VITAL STATISTICS 1982

INTRODUCTION

FOREWORD

This report summarizes data compiled from original birth, death, stillbirth, marriage, and dissolution (of marriage) records filed with the Office of Vital Statistics (VS) as required by law. Standard forms recommended by the U.S. Public Health Conference on Records and Statistics are used for certificates of birth, death, and fetal death (stillbirth).

Responsibility for filing birth certificates lies with physician, midwife, or other attendant. Funeral Directors, or persons acting as such, are legally charged with filing death and fetal death (of 20 or more weeks gestation) certificates. These are submitted to local registrars who in turn forward to VS. VS receives marriage and dissolution records directly from the various courts. Induced abortion reports are sent in directly by physicians, hospitals and clinics.

HISTORICAL BACKGROUND

This marks the 65th year of statewide collection of birth and death records, begun in 1917. Florida was admitted to the Death Registration Area in 1919, and to the Birth Registration Area in 1924, by virtue of having met all U.S. Bureau of Census criteria. Marriage and dissolution records have been filed with VS since June 1927, abortion reports since April 1972.

RESIDENT AND RECORDED EVENTS

Births and deaths are tabulated according to both usual place of residence (events occurring to Florida residents regardless of place of occurrence) and place of occurrence (events occurring in Florida regardless of usual residence). The former are herein referred to as resident, the latter recorded, events. Resident data have been tabulated since 1933, the year in which interstate exchange of vital records began. Prior to 1933, only recorded data are available.

Varying interpretations of "Usual residence" by Florida's many seasonal visitors and military families may influence the accuracy of resident tabulations to some extent, since the residence stated on the certificate is normally accepted without question. Institutional deaths, wherever possible, are allocated to the county from which the person was admitted. For births and stillbirths, the mother's residence is used when it differs from the father's.

Marriage, dissolution and abortion data are by place of occurrence only; there is no interstate exchange of these records. However, Florida dissolutions of marriage are granted to legal residents only; so there can only be resident dissolutions.

CAUSE OF DEATH

The underlying cause of death is determined from death certificate medical information in accordance with procedures established by the World Health Organization and the National Center for Health Statistics (NCHS). Standardized codes are assigned from the International Classification of Diseases (ICD).

To keep abreast of changes in medical knowledge ICD is revised approximately every 10 years. Revisions and years used in Florida are:

Revision	Years Used	Revision	Years Used
Second	1917-1920	Sixth	1949-1957
Third	1921-1929	Seventh	1958-1967
Fourth	1930-1940	Eighth	1968-1978
Fifth	1941-1948	Ninth	1979-

Due to these revisions, some of which involve major changes, year-to-year comparisons of deaths by cause can be misleading, unless such comparisons span a period of years in which only one revision was used, or the changes from one revision to another were minor.

The Ninth Revision contains major modifications of some sections, so that more deaths are now assigned under Eighth Revision rules, and vice versa. NCHS coded a sample of 1976 U.S. deaths by both Eighth and Ninth Revision rules. The results were grouped by major causes, and for each of these, the number of Ninth Revision deaths was divided by the number of Eighth Revision deaths to produce a comparability ratio. For example, the comparability ratio for Suicide is 1.0032; this implies that Ninth Revision coding of a given set of death certificates will produce about 32/100ths of one percent more Suicides than would Eighth Revision rules.

National comparability ratios are shown in Table M for Florida's leading causes of death. When comparing deaths from these causes for 1979 or later to those for 1968-78, the ratio multiplied by the earlier data (either number of deaths or death rate) will yield an approximation of the data which would have resulted under Ninth Revision rules.

AVAILABILITY OF DATA

In addition to data presented here, much greater detail is available from unpublished tables upon request. Also special statistical tapes and tables may be requested on a fee-for-service basis. Information concerning data available from these sources may be obtained from Public Health Statistics Section, P.O. Box 210, Jacksonville, Fla. 32231 Phone (904) 354-3961, or SUNCOM 673-3180.

RACE

Race is usually counted as it is stated on birth, death and marriage certificates, with such designations as "Hispanic" counted as white. For births, the child is counted as white if both parents are white, or if one is white and the other unknown or not stated; the child is counted as nonwhite in all other cases where the race of at least one parent is known; the race is left as unknown or not stated only when both parents are unknown. Specific nonwhite races are assigned according to a somewhat complex coding procedure, copies of which are available on request. The 1970 U.S. Census for Florida showed a population that was 15.3 percent black and less than 0.4 percent other nonwhite races. The 1980 U.S. Census shows 13.8 percent black and 2.2 percent other nonwhite. This increase in the size of the other nonwhite population results mainly from changes in the Census Bureau's definitions.

FLORIDA VITAL STATISTICS 1982

UNKNOWN

Tabular totals in this publication may include some records of unknown age, race or sex. In these cases the components shown will not add to the total.

COMPLETENESS OF DATA

Tabulation of data for this annual report was begun after allowing a reasonable time for receipt of late records. A few certificates were received after tabulation and are not included in this report. These

records represent only a small fraction of the total, and their omission does not materially alter the facts presented.

ACKNOWLEDGEMENT

Basic tabulations for this report were prepared by the Office of Management Systems, and we gratefully acknowledge their able assistance in designing and maintaining the vital statistics data system.

The following procedures and symbols are used in all Tables.

- (1) All rates and ratios are rounded to the nearest tenth.
- (2) All rates and ratios that calculate to less than 0.05 are printed as "0.0".
- (3) Undefined rates and ratios, i.e., those with denominator of zero, are printed as "- - -".
- (4) Anomalous rates and ratios, i.e., those that calculate to greater than 999.9, are also printed as "- - -".
- (5) Unreliable rates and ratios, i.e., those with denominator less than 100, are followed by an asterisk "**".
- (6) Age-adjusted death rates (AADR) standardized to U.S. 1940 standard population.

P O P U L A T I O N

FLORIDA VITAL STATISTICS 1982

Florida's population increased by an average of 3.6 percent annually during the 1970s, which was about six percent higher than the growth rate during the previous decade (1960-69). Despite this, the 1980-82 growth rate of 3.1 reveals a slight decrease in the trend.

The average annual numerical increase in population for 1970-79 of 292,752 includes a natural increase (excess of resident births over deaths) of 26,793. This results in an estimated net in-migration of 265,959 or 22,163 per month. This compares with a monthly in-migration of 11,014 during the 1960s.

The 1980-82 natural increase was down slightly (-5.1 percent) with a monthly figure of 21,041. The annual migration was 303,222 which is an increase of 3.6 percent. The white population increased by 2.4 percent

in 1982 with the nonwhites increasing 2.6 percent. These figures are both considerably lower than the average annual growth rates for the 1970s (Table B).

Comparing Florida's population to that of the U.S., Florida's nonwhite population was 16.1 percent of the state total in 1982, compared to the U.S. percentage of 14.4. In the 65-and-over age group, Florida was at 17.9 percent, well above the U.S. figure of 11.9 percent. The 14-and-under age group comprised only 17.8 percent of Florida's population vs 22.2 percent nationally (Table A).

Midyear population estimates are based on April 1 intercensal estimates by the Bureau of Economic and Business Research, University of Florida. U.S. data were obtained from the Bureau of Census Current Population Reports, series P-25 #929.

BASED ON DATA FURNISHED BY BUREAU OF ECONOMIC AND BUSINESS RESEARCH, UNIVERSITY OF FLORIDA

L I V E B I R T H S

FLORIDA VITAL STATISTICS 1982

Florida's resident live births rose by 5,979 (4.3 percent) in 1982 but remained lower than the 1980 record increase of 10,666 live births. The overall rate increased by 1.5 percent to 13.8 per thousand population. The rate for whites increased 2.5 percent while the nonwhites decreased 0.4 percent. The rate for nonwhites remains nearly double the rate for whites (Table C).

The general fertility rate of 64.5 per thousand females aged 15-44 in 1982 was up 3.0 percent over the 1979-81 average. Both whites and nonwhites also had increases of 3.6 and 0.9 percent, respectively. The rate for nonwhites remains about 1.6 times greater than the rate for whites. Fertility rates continue a downward trend among the teenage groups and a rising trend for women in their thirties. The median age of mothers also continued to increase for both race groups (Table D).

Although physicians continue to be the attendants to more than 90 percent of all live births, midwife deliveries are beginning to increase rapidly due to the use of the nurse midwife. In 1982 midwives attended 4.6 percent of white live births and 8.3 percent of nonwhite live births as compared to 1.3 and 3.6 percent, respectively, for the 1974-76 average. In 1982 physicians attended only 94.4 percent of white live births and 90.3 percent of nonwhite live births as compared to 99.7 and 94.7 percent for the 1969-71 average (Table E).

Birthweights under 2500 grams (5½ lbs.) are arbitrarily referred to as "low-weight". In 1982 only 7.5 percent of all resident live births were low-weight. All four race/sex groups have continued their downward trends through the 1970s and into the '80s. Studies have shown that the risk of neonatal mortality is much higher for low-weight births as opposed to "normal" weight births (Table F).

Since 1970 the percentage of unwed white mothers has risen from 6.5 to 12.0 but these are small in comparison with the nonwhite percentages which have risen from 41.1 to 59.2 over the same period. Since 1973 over half of all nonwhite mothers have been unmarried. In addition more than half of all mothers ages 10-19 in 1982 were unmarried. The percentage in this same age group was 33.8 for whites and 88.3 for nonwhites (Tables G and H).

Based on 1980 data, white females continue to have a greater life expectancy at birth, 78.7 years, than the other three race/sex groups. White females were followed by nonwhite females at 77.8 years, white males at 70.8 and nonwhite males at 68.2 (Table I).

FLORIDA VITAL STATISTICS 1982

In Florida, a fetal death certificate is required when the gestation period is 20 or more weeks. These deaths usually result from "spontaneous", i.e., not induced, abortions. Thus the probability that a given event would be included in both statistical entities, Induced Abortions and Fetal Deaths, is extremely low.

The fetal death ratio continued at a relatively low level, showing an increase of 2.8 percent to a ratio of 11.1 per thousand live births in 1982. The ratio for whites decreased 1.1 percent while nonwhites increased 10.4 percent (Table J).

A neonatal death is a death which occurs less than 28 days after the live birth. The combined total of fetal and neonatal deaths are referred to as "perinatal deaths", thus ranging from 20 weeks gestation through 27 days of life. Both the neonatal and perinatal death rates revealed similar patterns with the rates for whites showing virtually no change while the nonwhites showed slight increases (Table K).

Infant deaths are those which occur under one year of age. Infant death rates have shown an overall downward trend since 1960. The 1982 rate of 12.8 continues this trend with a 3.4 percent decrease from the 1981 rate of 13.3. The rate for whites in 1982 revealed a 2.9 percent decrease with the rate for nonwhites having decreased 3.3 percent (Table L).

G E N E R A L M O R T A L I T Y

FLORIDA VITAL STATISTICS 1982

Resident deaths decreased 0.6 percent in 1982 to 108,421 with the death rate decreasing 2.8 percent to 10.4 per thousand population. Although there has been an upward trend since 1950, due primarily to immigration of retirees, the rate dropped during the mid 70s before rising again. The death rate for whites in 1982 fell to 11.1 while the rate for nonwhites dropped to 6.8 per thousand population.

The age-adjusted death rates (AADR) continued their downward trends in 1982, decreasing to 5.3 for all races. The rates dropped to 5.2 and 5.8 for whites and nonwhites, respectively. AADRs are based on the number of deaths for each age group and takes into consideration the changes in the likelihood of death based on the age distribution of the population. All AADRs used in this report are standardized to the U.S. 1940 standard population (Table M).

Heart Disease, Cancer, Stroke and Accidents continued as Florida's top four leading causes of death, respectively, accounting for 73.7 percent of all deaths in 1982 as compared to 72.4 percent in 1972. During the period from 1972 to 1982, COLD rose to fifth, replacing Pneumonia and Influenza, now sixth. Suicide rose from the tenth to seventh position while Homicide

took over the tenth spot. Cirrhosis dropped to eighth and Diabetes to ninth while Perinatal Condition dropped from ninth to twelfth. Atherosclerosis remained in the eleventh position.

Among whites for the 1972-1982 period, the top five causes remained the same. They were: Heart Disease, Cancer, Stroke, Accidents and COLD, respectively. Suicide rose to sixth, while Pneumonia and Influenza fell to seventh and Cirrhosis to the eighth position. Diabetes remained ninth and Atherosclerosis tenth with Homicide rising to twelfth.

Heart Disease, Cancer, Stroke, Accidents and Homicide remained as the five leading causes among the nonwhites. Perinatal Condition rose to sixth while Diabetes remained seventh. Cirrhosis rose to eighth and COLD to ninth with Pneumonia and Influenza dropping from sixth to tenth. Atherosclerosis was fourteenth and Suicide fifteenth in 1982 (Table N).

Once Florida's leading cause of death, back on 1917, Tuberculosis now ranks about twenty-ninth among major cause groups, based on 1982 data. Although the general trend has been downward since 1950, there still remains a dangerous surplus of infection which needs to be monitored.

MARRIAGES
&
DISSOLUTIONS

FLORIDA VITAL STATISTICS 1982

The marriage rate for 1982 of 11.1 per thousand population showed no change from the 1981 rate, thus remaining as Florida's all-time highest marriage rate. The number of marriages increased by only 2.5 percent from the 1981 figure.

The dissolutions of marriage (including annulments) rate decreased by 8.1 percent in 1982 to 6.8 per thousand population, thus resulting in the state's lowest rate since 1972. This in turn caused the rate of dissolutions per 100 marriages to fall to 61.5, the lowest rate since a rate of 57.9 occurred in 1971.

Many of Florida's dissolutions are granted to persons who establish residency in the state specifically for this purpose. These cases account for most of the difference between the Florida and U.S. dissolution rates, as well as for the high ratios of dissolutions per 100 marriages in Florida as compared to a provisional rate of 47.3 nationally.

This ratio in Florida remains well below its 1975 peak of 74.3. As other states become more liberal in their divorce laws, the difference between Florida and the nation should continue to lessen.
